# Making RDAHMM into a Web Service

Prof. Ass. Dr. Isak Shabani

The service returns output result files as URLs.

This is a portal client to a data mining service that I built. The web service

GPS data comes from the Scripps GRWS Web Service. Instead of defining a data type for this file, we just pass around URLs. The RDAHMM service receives the URL as input.

The lesson: don't go overboard with XML message definitions. You will regret it. Use URLs and keep your SOAP/WSDL simple.
